

Com S 227
Spring 2021
Miniassignment 2
50 points

Due Date: Friday, March 26, 11:59 pm (midnight)
5% bonus for submitting 1 day early (by 11:59 pm Mar 25)
10% penalty for submitting 1 day late (by 11:59 pm Mar 27)
No submissions accepted after March 27, 11:59 pm

General information

This assignment is to be done on your own. See the Academic Dishonesty policy in the syllabus for details.

You will not be able to submit your work unless you have completed the *Academic Dishonesty policy acknowledgement* on the Homework page on Canvas. Please do this right away.

If you need help, see your instructor or one of the TAs. Lots of help is also available through the Piazza discussions.

Note: This is a miniassignment and the grading is automated. If you do not submit it correctly and we have to run it by hand, you will receive at most half credit.

Overview

This is a short set of practice problems involving arrays. You will write eight methods for the class `mini2.JustAnOrdinArrayDay`. All of the methods are static, so your class will not have any instance variables (or any static variables, for that matter). There is a constructor, but it is declared `private` so the class cannot be instantiated.

For details and examples see the online Javadoc. There is a skeleton of the class on Canvas. If you use the skeleton code, be sure you put it in a package called `mini2`.

Advice...? Pretty much the same as for miniassignment 1

Before you write any code for a method, work through the problem with a pencil and paper on a few concrete examples. Make yourself write everything down; in particular, write down things that you need to remember from one step to the next (such as indices, or values from a previous step). Try to explain what you are doing in words. Write your algorithm in pseudocode. Explain it to your grandma. Explain it to your cat. Your cat won't care at all, but you'll feel better.

The other key problem-solving strategy is to remember that you don't have to solve the whole problem in your head all at once. Try solving *part* of the problem, or solving a *related, simpler problem*. For example:

- If you are working on `isPalindrome`, can you
 - a. check whether the first and last elements are the same?
 - b. check whether the second and second-to-last elements are the same?
 - c. iterate up to the middle of the array, checking whether the i th element matches the one that is the i th before the end?
- If you are working on `sortIntoBins`, can you
 - a. create an array to return whose length is `numBins`?
 - b. iterate over the data and identify the values that are between `min` and `max`?
 - c. iterate over the data and calculate the index of the bin for each value x , that is, $(x - \text{min}) / \text{numBins}$, rounded down to the next lowest int?
- If you are working on `shiftLeft`, can you
 - a. determine whether `amount` is greater than the length of the array?
 - b. identify the element that should go at index 0?
 - c. copy everything after that element to the correct position?
 - d. fill in the remainder with zeros?
- If you are working on `shiftRight`, can you
 - a. determine whether `amount` is greater than the length of the array?
 - b. identify the element that should go at the end of the array?
 - c. copy everything before that element to the correct position?
 - d. fill in the remainder with zeros?
- If you are working on `cycle`, can you

- a. handle the case where **amount** is a positive number less than the array length?
(*Tip*: this is easiest if you create a temporary array to store the result, then copy it back to **arr** when you're done)
 - b. use modular arithmetic to convert any **amount** into a positive number less than the array length?
- If you are working on **removeMultiples**, can you
 - a. write a loop to answer the question: does a given array contain a given value?
(*Tip*: don't forget that you can't use **==** to compare strings!)
 - b. write a loop to copy each element to a temporary array or list?
 - c. write a loop to copy each element to a temporary array or list, but only if it isn't already present in the temporary array?
- If you are working on **longestAscending**, can you
 - a. identify a similar problem from miniassignment 1 and adapt your solution?
- If you are working on **makeIntoPalindrome**, can you
 - a. given an array **arr**, find the smallest index **start** such that the sub-array **arr[start]** through **arr[length - 1]** is a palindrome? (*Tip*: use *isPalindrome* as a helper method!)
 - b. create a new array that would be the correct size for extending **arr** to be a palindrome?
 - c. copy all the elements of **arr** into the correct positions?

My code's not working!!

If you are getting errors, a good idea is to go back to a simple concrete example, and trace execution of your code by hand to see if the code is doing what you want it to do. You can also trace what's happening in the code by temporarily inserting **println** statements to check whether variables are getting updated in the way you expect. (Remember to remove the extra **println**'s when you're done!) *Note*: you can easily print out an array **arr** of primitives or Strings using the static method **Arrays.toString**, which is part of the class **java.util.Arrays**, for example:

```
System.out.println(Arrays.toString(arr));
```

Ultimately, of course the best way to trace through code with the debugger, as we are practicing in Lab 6. (For easily visualizing short programs, it can be more convenient to use *pythontutor*.)

If you have an infinite loop, please refer to link #12 on our Canvas front page for additional tips.

You have absolute power. Use it!

You really do have absolute, godlike power when it comes to your own code. If the code isn't doing what you want it to do, you can decide what you really want, and make it happen. *You are in complete control!*

(If you are not sure what you *want* the code to do, well, that's a different problem. Go back to the "Advice" section.)

The SpecChecker

A SpecChecker will be posted with a number of functional tests. However, when you are debugging, it is usually helpful if you have a simpler test case of your own.

For test cases involving arrays, it's useful to take advantage of the Java literal notation for arrays, using curly braces:

```
import static mini2.JustAnOrdinArrayDay.*;
import java.util.Arrays;

public class ArrayTester
{
    public static void main(String[] args)
    {
        int[] test = {10, 20, 30, 40, 50, 60};
        shiftRight(test, 4);
        System.out.println(Arrays.toString(test));
        // expected [0, 0, 0, 0, 10, 20]
    }
}
```

Since no test code is being turned in, you are welcome to post your tests on Piazza for others to use and comment on.

Documentation and style

Since this is a miniassignment, the grading is automated and in most cases we will not be reading your code. Therefore, there are no specific documentation and style requirements. However, writing a brief descriptive comment for each method will help you clarify what it is you are trying to do. Likewise, brief internal comments can help you keep track of what you are trying to do when you write a tricky line of code.

If you have questions

For questions, please see the Piazza Q & A pages and click on the folder **miniassignment2**. If you don't find your question answered, then create a new post with your question. Try to state the question or topic clearly in the title of your post, and attach the tag **miniassignment2**. *But remember, do not post any source code for the classes that are to be turned in.* It is fine to post source code for general Java examples that are not being turned in. (In the Piazza editor, use the button labeled “pre” to have Java code formatted the way you typed it.)

If you have a question that absolutely cannot be asked without showing part of your source code, make the post “private” so that only the instructors and TAs can see it. Be sure you have stated a specific question; vague requests of the form “read all my code and tell me what’s wrong with it” will generally be ignored.

Of course, the instructors and TAs are always available to help you. See the Office Hours section of the syllabus to find a time that is convenient for you. We do our best to answer every question carefully, short of actually writing your code for you, but it would be unfair for the staff to fully review your assignment in detail before it is turned in.

Any posts from the instructors on Piazza that are labeled “Official Clarification” are considered to be part of the spec, and you may lose points if you ignore them. Such posts will always be placed in the Announcements section of the course page in addition to the Q&A page. (We promise that no official clarifications will be posted within 24 hours of the due date.)

What to turn in

Note: You will need to complete the "Academic Dishonesty policy questionnaire," found on the Homework page on Blackboard, before the submission link will be visible to you.

Please submit, on Canvas, the zip file that is created by the SpecChecker. The file will be named **SUBMIT_THIS_mini2.zip**, and it will be located in the directory you selected when you ran the SpecChecker. It should contain one directory, **mini2**, which in turn contains one file, **JustAnOrdinArrayDay.java**. Always LOOK in the zip file the file to check.

Submit the zip file to Canvas using the Miniassignment2 submission link and verify that your submission was successful. If you are not sure how to do this, see the document "Assignment Submission HOWTO" which can be found in the Piazza pinned messages under “Syllabus, office hours, useful links.”

*We strongly recommend that you just submit the zip file created by the specchecker, AFTER CHECKING THAT IT CONTAINS THE CORRECT CODE. **If you mess something up and we have to run your code manually, you will receive at most half the points.***

We strongly recommend that you submit the zip file as created by the specchecker. If necessary for some reason, you can create a zip file yourself. The zip file must contain the directory **mini2**, which in turn should contain the file **JustAnOrdinArrayDay.java**. You can accomplish this by zipping up the **src** directory of your project. The file must be a zip file, so be sure you are using the Windows or Mac zip utility, and not a third-party installation of WinRAR, 7-zip, or Winzip.
